On a typical drawing project, a few staff people work in a CAD room, which is equipped with a CAD station, a multifunctional laser printer, a desk, a computer, and a mouse and keyboard. The CAD station is equipped with a computer and printer, and it supports the following applications: drawing, design, drafting, animation, math, and presentation. A small group of people use the CAD room to design and draft, while others use it as an office. In addition, clients use the CAD room to make viewing and editing changes to drawings after they are printed. Design is the process of creating the three-dimensional object of a design and shaping its surface. Most CAD applications are used to design buildings, factories, office buildings, houses, interiors, furniture, and other types of objects. The computer itself can be used as a drafting tool to plan out individual pieces and reassemble them on the finished object. The drawing window is where the user views the CAD model as a blueprint or drawing. Many new users find the drawing window intimidating because it has such a large number of features. At its simplest, a drawing is a two-dimensional, geometric representation of a three-dimensional object. The drawing window in AutoCAD displays the model using a three-dimensional coordinate system called axonometric. It allows the designer to select the view of the object and zoom in on it for detailed study. Most CAD programs offer numerous drawing tools such as dimensioning tools, object snap, line tools, and dynamic filters that help the designer to draw a plan or create drawings. A particular drawing tool, such as a dimension line, is a narrow line that is used to create a drawing frame, often in conjunction with the pencil tool. The drawing frame is used to help the user to lay out a section of the drawing, or drawing plane, while the user places the dimension line at an angle. Dynamic filters are used to change the look of the drawing, making it easier for the user to focus on one particular area of the drawing. The most commonly used tools are the pencil tool, line tool, dimension line, and rotation tools. The drawing tools are: Pencil: This is the most commonly used tool in a CAD drawing. The pencil tool is used to create line objects, freehand, or to draw shapes that have been created. Point: The point tool is similar to the pencil tool. However, it is used to draw points,

development version to a new version of Ember.js, the package.json has an update section for each dependencies as well as an update section with the new version number. Is there a way to have the new version number show up as a link in the console output? I would also like to know if there is a better way of handling this other than using the console.log() command. A: You could use ember-cli-log-analyzer to hide the version number. Ember CLI has an ember-cli-log-analyzer module which can be used to hide or show information in your console. The module exports a single function hideVersion that can be used to either display the version number or hide it. In your ember-cli-build.js file, you would add: /*global hideVersion*/ hideVersion: function(version) { return function(logLevel, options) { // add your console calls } } Q: Is it possible to use a double value from a text file to plot an area graph in Python? I'm trying to plot a simple area graph, but the values I need are stored in a text file in the form "2.5 3.0 4.0 5.0" where the integers represent the X- and Y-axis values, respectively. Is there a way to read the text file and convert the integers to double values? A sample of the text file I'm using is: 2.5 3.0 4.0 5.0 6.5 7.5 8.5 9.5 10.5 11.5 12.5 13.5 14.5 15.5 16.5 17.5 A: You can use pandas.read_csv() to import the file and then use its df.values to convert from string to float and finally plot as you normally would. import pandas as pd import matplotlib.pyplot as plt
